

## New Missions to Venus: NASA

---

 [drishtias.com/printpdf/new-missions-to-venus-nasa](https://drishtias.com/printpdf/new-missions-to-venus-nasa)

### Why in News

---

Recently, the **National Aeronautics and Space Administration (NASA)** announced **two new robotic missions to Venus**.

Earlier, scientists obtained **new data about Venus by bouncing radio waves** off the planet.

### Key Points

---

- **Aim:**

The two sister missions aim to **understand how Venus became an inferno-like world capable of melting lead at the surface**.
- **About:**
  - **DaVinci Plus:**

It will be the first of the two, **it will analyze the thick, cloudy Venusian atmosphere** in an attempt to **determine whether the inferno planet ever had an ocean and was possibly habitable**. A small craft will plunge through the atmosphere to measure the gases.
  - **Veritas:**

It will be the second one seeking a **geologic history by mapping the rocky planet's surface**.
- **Significance:**

The new missions will **give fresh views of the planet's atmosphere, made up mostly of carbon dioxide, down to the core**.

- **Previous Missions:**

- **US:**

- **Mariner** series 1962-1974, **Pioneer Venus 1** and **Pioneer Venus 2** in 1978, **Magellan** in 1989.

- **Russia:**

- **Venera** series of space crafts 1967-1983, **Vegas 1** and **2** in 1985.

- **Japan:**

- **Akatsuki** in 2015.

- **Europe:**

- **Venus Express** in 2005.

- **Indian Initiative:**

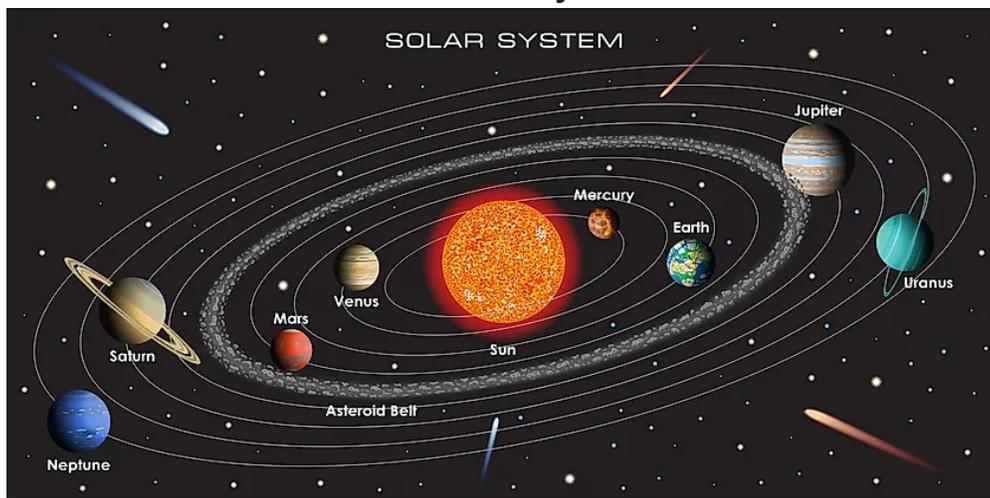

- India plans to launch a new orbiter named **Shukrayaan** to Venus in 2024.

## Venus

---

- **About:**

- It is named after the Roman goddess of love and beauty. It is the **second planet from the Sun** and **sixth in the solar system in size and mass.**

- It is the **second brightest** natural object in the night sky **after the Moon**, probably that is the reason why it was the **first planet to have its motions plotted across the sky**, as early as the second millennium BC.
  - Unlike the other planets in our solar system, **Venus and Uranus spin clockwise** on their axis.
  - It is the **hottest planet** in the solar system because of the **high concentration of carbon dioxide** which works to produce an intense **greenhouse effect**.
  - A **day on Venus is longer than a year**. It takes Venus **longer to rotate once on its axis than to complete one orbit of the Sun**.

- That's **243 Earth days to rotate once** - the longest rotation of any planet in the Solar System - and only **224.7 Earth days to complete one orbit of the Sun**.

- **Venus & Earth:**
  - Venus has been called **Earth's twin** because of the **similarities in their masses, sizes, and densities and their similar relative locations** in the solar system.
  - No planet approaches closer to Earth than Venus; at its nearest **it is the closest large body to Earth other than the Moon.**
  - Venus has **90 times the atmospheric pressure of Earth.**
- **Reason For Studying Venus:**
  - It will help to learn **how Earth-like planets evolve and what conditions exist on Earth-sized exoplanets** (planets that orbit a star other than our sun).
  - It will help in modelling **Earth's climate**, and serves as a cautionary tale on how dramatically a planet's climate can change.
