

Dzukou Valley

Why in News

The two-week long [forest fire](#) in Dzukou valley on Nagaland-Manipur border has been doused.

- The **90-sq km green valley** has been **prone to forest fires for decades** - in 2015, 2012, 2010 and 2006.

Key Points

- **Location:** The Dzukou Valley, **popularly known as the ‘valley of flower’**, is located at the **border of Nagaland and Manipur**.
- **Features:**
 - Situated at **an altitude of 2,438 metres** behind the **Japfu mountain range**, it is one of the most **popular trekking spots** in the North East.
 - Dzukou valley and Japfu peak are located **adjacent to the Pulie Badze Wildlife Sanctuary (Nagaland)**.
 - There are **no human habitations within the forests**, but they are **home to rare and ‘vulnerable’ (as per the IUCN Red List) birds** - **Blyth’s Tragopan** (Nagaland’s state bird), the **Rufous-necked Hornbill** and the **Dark-rumped Swift**, among many others. Also found in the forests are **endangered Western Hoolock Gibbons**.
 - It is **covered with bamboo** and other grass species. The valley harbours many species of flowering plants including the **endemic Dzukou Lily- Liliium chitrangada**.
 - The valley is a **source of conflict** for ownership between local tribes and the state governments of Manipur/Nagaland.
 - It is home to the **Angami people**.

Forest Fires

- **Description:**
 - **Wildfire**, also called **forest, bush or vegetation fire**, can be described as any **uncontrolled and non-prescribed combustion** or burning of plants in a natural setting such as a forest, grassland, brush land or tundra, which consumes the natural fuels and **spreads based on environmental conditions** (e.g., wind, topography).
- **Causes:**
 - Wildfire **can be incited by human actions**, such as land clearing, extreme drought or in rare cases by **lightning**.
 - **One of the major reasons for forest fires in the north-east is slash-and-burn cultivation**, commonly called **jhoom or jhum cultivation**.
 - The fires happen between the months of January and March. The north-east has tropical evergreen forests and, unlike the dry deciduous forests of central India, these are not likely to catch fire easily.
- **Impact:**
 - Globally, forest fires **release billions of tons of CO₂ into the atmosphere**, while hundreds of thousands of **people are believed to die due to illnesses caused by exposure to smoke** from forest fires and other landscape fires.
- **Some Findings from the 2019 Report by the Forest Survey of India (FSI):**
 - About **21.40% of forest cover in India is prone to fires**, with forests in the **north-eastern region and central India being the most vulnerable**.
 - While the **overall green cover has increased** in the country, the **forest cover in the north-east** — particularly in Mizoram, Arunachal Pradesh and Nagaland — has **decreased. Forest Fires** could be **one of the causes**.
- **Measures Taken:**
 - National Action Plan on Forest Fires (NAPFF) 2018
 - Forest Fire Prevention and Management Scheme.
