Card on File Tokenisation (CoFT)

For Prelims: Card-on-file tokenisation (CoF), Card-on-File, Reserve Bank of India (RBI)

For Mains: Issues related to Card on File Tokenisation (CoFT)

Why in News

The <u>Reserve Bank of India (RBI)</u> has extended the timeline for implementation of the new credit and debit card data storage norms, or card-on-file tokenisation (CoF) by six months to 30th June, 2022.

- The digital payment firms, merchant bodies and banks had **sought more time to integrate the systems and onboard all the stakeholders** amid fears over disruption of business transactions.
- In September 2021, the <u>RBI prohibited merchants from storing customer card details</u> on their servers with effect from 1st January, 2022, and mandated the adoption of CoF tokenisation as an alternative to card storage.

Ш

IORE TEDIOUS?

E-tailers & payment gateways currently offer to store card details, including the 16-digit number

RBI's ban on storing card data would require e-commerce firms to opt for tokenisation or ask customers to enter the card number

Tokenisation refers to payment networks linking card data to a token, which is given to the merchant

This token can be used for payments but only by the specified merchant The new rule will become the norm for all card-based transactions in e-commerce from Jan 2022

According to a source, the threat of ransomware attacks have increased manifold

Online firms won't be able to store card info & debit recurring payments

(won't affect billers added with bank directly)

It is thought RBI's move is aimed at increasing customer safety & improving data security

Key Points

- About:
 - Tokenisation: It refers to replacement of actual credit and debit card details with an alternate code called the "token", which will be unique for a combination of card, token requestor and device.
 - A tokenised card transaction is **considered safer** as the actual card details are not shared with the merchant during transaction processing.
 - Customers who do not have the tokenisation facility will have to key in their name, 16-digit card number, expiry date and CVV each time they order something online.
 - **Card-on-File:** A CoF transaction is a transaction where a cardholder has authorised a merchant to store the cardholder's Mastercard or Visa payment details.
 - The cardholder then authorises that same merchant to bill the cardholder's stored Mastercard or Visa account.
 - <u>E-commerce</u> companies and airlines and supermarket chains normally store card details in their system.
- More Time Sought for Implementation:
 - If the new RBI mandate is implemented in the present state of readiness, it could cause **major disruptions and loss of revenue**, especially for merchants.
 - Online merchants can **lose up to 20-40 % of their revenues** post 31st December due to tokenisation norms, and for many of them, especially smaller ones, this would sound the death knell, causing them to shut shop.
 - Disruptions of this nature **erode trust in digital payments and reverses consumer habits** back towards cash-based payments.
 - Merchants cannot start the testing and certification of their payment processing systems until banks and card networks are certified and live with stable APIs (Application Programming Interface) for consumer-ready solutions.

Way Forward

- The RBI has said that after June 2022, credit and debit card data should be purged from the online systems of merchants.
- In addition to tokenisation, industry stakeholders may devise alternate mechanisms to handle any use case, including recurring e-mandates and EMI option or post-transaction activity, including chargeback handling, dispute resolution, reward or loyalty programme, that currently involves storage of CoF data by entities other than card issuers and card networks.
