

## **Muons Penetrate Ancient Xi'an Fortress Wall**

## Why in News?

As per a new study, researchers are **examining the fortress wall of Xi'an, an ancient city in China,** by using tiny outer space particles Muons that can penetrate hundreds of metres of stone surfaces.

 Scientists have used a muon detector, called CORMIS (Cosmic Ray Muon Imaging System), to examine the wall of Xi'an city.

## What are Muons?

- About:
  - Muons are subatomic particles raining from space. They are created when the particles in Earth's atmosphere collide with cosmic rays.
    - <u>Cosmic rays</u> are the **clusters of high-energy particles** that move through space at almost the **speed of light**.
  - According to Scientific American magazine, "about 10,000 muons reach every square metre of the Earth's surface a minute".
- Properties:
  - These particles resemble electrons but are 207 times as massive. Therefore, they are sometimes called "fat electrons".
  - Because muons are so heavy, they can travel through hundreds of metres of rock or other matter before getting absorbed or decayed.
    - In comparison, electrons can penetrate through only a few centimetres.
  - Also, muons are highly unstable and exist for just 2.2 microseconds.

## What is Muography?

- About:
  - The method of scanning large structures owing to the penetration power of muons is called Muography.
- Applications of Muography:
  - Archaeology:
    - With unique advantages, muography has gained increasing attention from archaeologists as a novel and innovative tool to investigate large-scale archaeological sites.
      - Example: The first use of muography was in the late 1960s when a **Nobel Prize-winning physicist named Luis Alvarez** teamed up with Egyptologists to look for **hidden rooms in the Pyramid of Khafre in Giza**.
  - Other Applications:
    - Muography has also found use in customs security, internal imaging of volcanoes and others.
      - In 2015, scientists used the technique to look inside the <u>Fukushima</u> nuclear reactors after the 2011 earthquake and <u>tsunami in Japan</u>.
      - It is also being used by researchers to analyze <u>Mount Vesuvius</u>, a volcano in Italy.
