

# Hunter Syndrome: MPS II

## Why in News

Two brothers suffering from **Mucopolysaccharidosis II or MPS II (Hunter Syndrome, Attenuated Type)** have approached the Delhi High Court seeking direction to the Centre and AIIMS to provide them free treatment.

- **MPS II is a rare disease** that is passed on in families.

## Key Points

- **About:** MPS II mostly **affects boys** and their bodies **cannot break down a kind of sugar** that **builds bones, skin, tendons and other tissues**.
- **Cause:** It is **caused by changes (mutations) of the IDS gene** that regulates the production of the iduronate 2-sulfatase (I2S) enzyme.
  - This enzyme is **needed to break-down complex sugars**, known as **glycosaminoglycans (GAGs)**, produced in the body.
- **Impact:** Lack of I2S enzyme activity **leads to the accumulation of GAGs within cells**, specifically inside the **lysosomes**.
  - Lysosomes are compartments in the cell that **digest and recycle different types of molecules**.
  - Conditions that cause molecules to build up inside the lysosomes, including MPS II, are called **lysosomal storage disorders**.
  - The accumulation of GAGs increases the size of the lysosomes, which is why **many tissues and organs are enlarged in this disorder**.
- **Symptoms:** It is characterized by **distinctive facial features, a large head, enlargement of the liver and spleen (hepatosplenomegaly)**, hearing loss, etc.
- **Inheritance:**
  - MPS II is inherited in an X-linked recessive pattern, which means that this condition occurs almost exclusively in males. **Females are generally unaffected carriers of this condition**.
  - In a family with more than one affected individual, the mother of the affected males must be a carrier. When a carrier female has a child, there is a 25% (1 in 4) chance that she will have an affected son.

## Rare Diseases

- A rare disease is a **health condition of low prevalence** that affects a small number of people compared with other prevalent diseases in the general population.
- Though rare diseases are of low prevalence and individually rare, collectively they **affect a considerable proportion of the population**.
- **80% of rare diseases are genetic in origin** and hence disproportionately impact children.
- Recently, the Delhi High Court has directed the Centre to **finalise the National Health Policy for Rare Diseases of 2020** by March 2021 and [make operational provision of crowdfunding](#)

envisaged under the law for treatment of high-cost rare diseases.
