

Silicosis

Why in News

In India, countless workers engaged in mines, construction and factories are silently dying of exposure to dust. This is better referred to as [silicosis](#).

- Silicosis can be described as an **occupational disease or hazard** due to dust exposure. It is incurable and can cause permanent disability.
- However, it is **totally preventable by available control measures and technology**.

Key Points

▪ About Silicosis

- Silicosis occurs most commonly in people working in the quarrying, manufacturing, and building construction industries.
 - **Silica (SiO_2 /silicon dioxide)** is a crystal-like mineral found in abundance in sand, rock, and quartz.
- It is a **progressive lung disease** caused by the **inhalation of silica over a long period of time**, characterized by shortness of breath, cough, fever and bluish skin.
- It is one of the **most prevalent occupational health illnesses in the world**. It is also reported from the population with non-occupational exposure to **silica dust** from industrial as well as non-industrial sources.
- Exposure to large amounts of free silica may not be noticed because silica is **odourless, non-irritant** and does not cause any immediate health effects, but long-term exposure is associated with **pneumoconiosis, lung cancer, pulmonary tuberculosis, and other lung diseases**.
 - **Pneumoconiosis** is one of a group of interstitial lung diseases caused by breathing in certain kinds of dust particles that damage your lungs.
- **Diagnosis** is a challenge because it is **difficult** to even find out if a person has **tuberculosis or silicosis**.
- The nodules that collect to form a mass can take up to 20 years to be identified in chest x-rays and the victim notices symptoms only after many years of exposure to silica.
 - Grossly, silicotic **nodules are firm, discrete, rounded lesions** that contain a variable amount of black pigment.
 - The nodules tend to **occur around respiratory bronchioles** and small pulmonary arteries.
- In India **silicosis is prevalent in Gujarat, Rajasthan, Pondicherry, Haryana, Uttar Pradesh, Bihar, Chhattisgarh, Jharkhand, Orissa and West Bengal** among the workers of construction and mining.

▪ Steps Taken by The Government

- **Legal Protections:** Silicosis is a notified disease under the Mines Act (1952) and the Factories Act (1948).
 - **Factory Act of India (1948)** mandates a well-ventilated working environment, provisions for protection from dust, reduction of overcrowding and provision of basic occupational health care.
- **Silicosis Portal:** A 'silicosis portal' was hosted by the Department of Social Justice and Empowerment.
- **Self-Registration:** A system of worker self-registration, diagnosis through district-level pneumoconiosis boards and compensation from the [District Mineral Foundation Trust \(DMFT\)](#) funds to which mine owners contribute.
- **[Occupational Safety, Health, and Working Condition Code 2020 \(OSHC\)](#):**
 - The code makes it mandatory for all employers to provide annual health checks free of cost as prescribed by the appropriate Government.

▪ Associated Challenges

- **Low rates of notification:** Low rates of notification of silicosis by the mining sector. Most of the time silicosis is diagnosed as tuberculosis.
- **Inhuman Cycle:** Present system is designed to consume workers in the mining sector and dispense them with small compensation and replace them with next able workers.
- **Loopholes in OSHWC Code:** The code places **no obligation on the mine owner** to provide any form of rehabilitation in terms of alternative employment in the mine, or payment of a disability allowance/lump sum compensation for a worker found medically unfit.
- **Underutilized Funds:** The DMFT funds are both underutilised and spent in an entirely ad

hoc manner.

Way Forward

- **Rajasthan Model:** Rajasthan has one of the top-most shares of over 17% in value of mineral production in the country and a long history of civil society activism.
 - Given this, Rajasthan became the first to notify silicosis as an 'epidemic' in 2015.
 - Further, in 2019, it announced a formal Pneumoconiosis Policy, only next to Haryana.
 - This model can be implemented by other mineral producing states also.
- **Proper Implementation of OSHWC:** The State rules under the OSHWC Code must take care to ensure the health checks are provided to all workers in all establishments, irrespective of age.
- **Incentivizing Local Manufacturers:** Local manufacturers must be incentivised to innovate and develop low-cost dust-suppressant and wet-drilling mechanisms that could either be subsidised or provided free of cost to the mine owners.
