

Kala Azar

Source: IE

Why in News?

India achieved significant progress in eliminating <u>Kala Azar (KA)</u>, reporting **less than one case per 10,000 population in 2023**, compared to previous years.

 Data from the <u>National Vector Borne Disease Control Programme</u> revealed a decline in Kala Azar cases, with 595 cases and four deaths reported in 2023 compared to 891 cases and three deaths in 2022.

Note:

- India has not yet eliminated KA but has made substantial progress towards its elimination goal.
 - India's initial target year for Kala Azar elimination was 2010, which was later extended to 2015, 2017, and then 2020.
- The <u>WHO</u> defines elimination for KA as having fewer than one case per 10,000 people at the sub-district (block Primary Health Centres) level in India. Once achieved, the elimination is to be sustained for 3 years for KA elimination certification.
 - India will need to sustain this momentum over the next three years to receive WHO certification, considering that India has missed at least four deadlines for Kala Azar elimination.
- In Oct 2023, Bangladesh became the first country, globally, to be officially validated by the WHO for eliminating Kala Azar as a public health problem.

What are the Key Facts About Kala Azar?

- About:
 - Kala-azar (visceral leishmaniasis), also known as Black Fever is a fatal disease caused by a protozoan parasite Leishmania donovani.
- Symptoms:
 - It is characterised by irregular bouts of fever, weight loss, enlargement of the spleen and liver, and anaemia.
- Prevalence:
 - Most cases occur in Brazil, east Africa and India. An estimated 50,000 to 90 000 new cases of VL occur worldwide annually, with only 25-45% reported to WHO. It has an outbreak and mortality potential.
- Transmission:
 - Leishmania parasites spread through bites of infected female sandflies, feeding on blood for egg production. Over 70 animal species, **including humans, can carry these parasites.**
- Major Risk Factors:
 - Poverty, poor housing, and sanitation.

- Diets lacking essential nutrients.
- Movement into high-transmission areas.
- Urbanisation, deforestation, climate change.

Diagnosis and Treatment:

- Suspected visceral leishmaniasis cases require immediate medical attention. Diagnosis involves clinical signs combined with parasitological or serological tests.
 - Left untreated, it can be **fatal in 95% of cases.**
- Prevention and Control:
 - **Early diagnosis and prompt treatment** are crucial in reducing disease prevalence, and preventing disabilities, and death.
 - **Vector control, such as insecticide spray** and the use of insecticide-treated nets, helps reduce transmission by decreasing the number of sandflies.
 - **Effective disease surveillance** is important for monitoring and acting during epidemics and high case fatality rates.
 - Social mobilization and strengthening partnerships, including community education and collaboration with stakeholders, are critical for effective control.
- India's Efforts to Control Kala Azar:
 - The Government of India launched a **centrally sponsored Kala-azar control program in 1990-91**, which was later revised in 2015.
 - n 1990-91, which was later revised in 2015.
 - The program aimed to eliminate Kala-azar by 2023, aligning with the WHO neglected tropical diseases (NTDs) Roadmap goal of 2030.
 - The National Vector Borne Disease Control Programme (NVBDCP), 2003 is an umbrella programme for prevention and control of vector borne diseases viz., malaria, lymphatic filariasis, kala azar, and chikungunya.
 - Recent Efforts:
 - Rigorous indoor residual spraying effort aimed at curtailing sandfly breeding sites; application of a **special soil to seal crevices in mud walls,** preventing sandflies from nesting.
 - Pucca houses in KA-affected villages have been constructed under PMAY-G A total of 25,955 houses in 2017-18 (1371 houses in Bihar & 24584 in Jharkhand).
 - Mobilisation of the ASHA (Accredited Social Health Activist) network to
 - ensure completion of treatment for PKDL patients, who require a 12-week course of Miltefosine (an antileishmanial agent).

Post-kala-azar Dermal Leishmaniasis (PKDL)

- PKDL is a skin condition that follows visceral leishmaniasis, causing rashes on the face, arms, and trunk.
- It affects mainly Sudan and the Indian subcontinent, with 5-10% of kala-azar patients developing it.
- PKDL may occur 6 months to a year after kala-azar treatment, potentially spreading Leishmania.

UPSC Civil Services Examination, Previous Year Questions (PYQs)

<u>Prelims:</u>

Q. Consider the following diseases: (2014)

- 1. Diphtheria
- 2. Chickenpox
- 3. Smallpox

Which of the above diseases has/have been eradicated in India?

(a) 1 and 2 only(b) 3 only

Ans: (b)
