

# Enriched Uranium Stockpile by Iran

## Why in News

Recently, Iran's atomic agency said that **its stockpile of 20% enriched uranium** has reached over 210 kilograms.

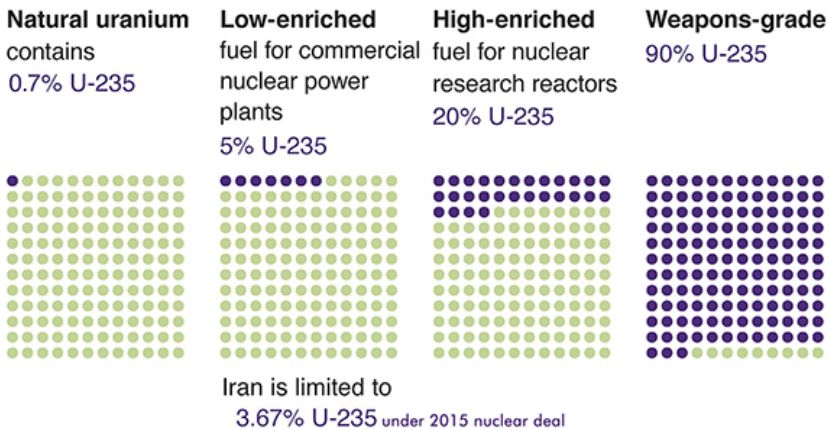

- In April 2021, the [International Atomic Energy Agency](#) (IAEA) said Iran had begun the process of enriching uranium to 60% fissile purity at an above-ground nuclear plant at Natanz.
- Under the **historic 2015 nuclear deal** between Iran and the World Powers, **Iran was not meant to enrich uranium above 3.67%**. Enriched uranium above 90% can be used for nuclear weapons.

## Key Points

- **Uranium Enrichment:**
  - **Natural uranium** consists of two different isotopes - **nearly 99% U-238** and only around **0.7% of U-235**.
    - **U-235 is a fissile material** that can sustain a chain reaction in a nuclear reactor.
  - **Enrichment process increases the proportion of U-235** through the process of isotope separation (U-238 is separated from U-235).
  - For **nuclear weapons**, enrichment is required upto **90% or more** which is known as weapons-grade uranium.
  - **Low-enriched uranium, which typically has a 3-5% concentration of U-235**, can be used to produce fuel for commercial nuclear power plants.
  - **Highly enriched uranium has a purity of 20% or more** and is used in research reactors.

## Uranium enrichment process

Increasing the concentration of **U-235** atoms, by removing **U-238**, means it can be used for nuclear fuel or bombs

### How much effort is required to get to weapons-grade uranium?

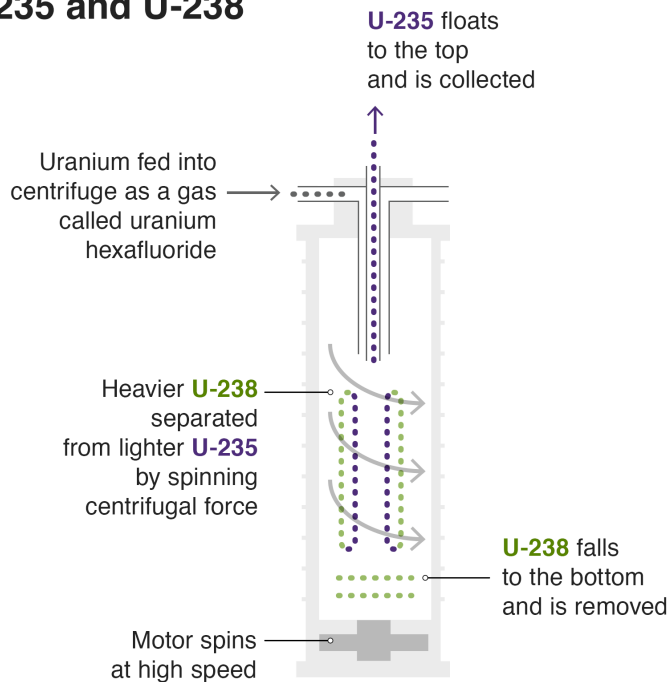

Very little extra effort is needed to get from 20% enriched uranium to bomb material

#### ▪ Associated Concerns:

- The tricky process of enrichment becomes far easier and requires fewer centrifuges as it moves into the higher purities.
- In other words, getting to 90% purity is much easier starting from 20%, and easier still starting from 60%.

## How a centrifuge separates uranium atoms, U-235 and U-238

### ▪ 2015 Nuclear Deal:

- In 2015, **Iran with the P5+1 group of world powers** - the USA, UK, France, China, Russia, and Germany agreed on a long-term deal on its nuclear programme.
  - The deal was named as **Joint Comprehensive Plan of Action (JCPOA)** and in common parlance as Iran Nuclear Deal.
  - Under the deal, **Iran agreed to curb its nuclear activity** in return for the lifting of sanctions and access to global trade.
  - The agreement **allowed Iran to accumulate small amounts of uranium** for research but it **banned the enrichment of uranium**, which is used to make reactor fuel and nuclear weapons.
  - Iran was also **required to redesign a heavy-water reactor being built**, whose spent fuel would contain plutonium suitable for a bomb and to allow international inspections.
- **In May 2018, the USA abandoned the deal** criticising it as flawed and reinstated and tightened its sanctions.
  - Since sanctions were tightened, **Iran has been steadily breaking some of its commitments** to pressure the remaining signatories to find a way to provide sanctions relief.
- After months of delays, the **European Union, Iran and the US** have recently announced that **indirect talks to resuscitate the deal would resume on 29<sup>th</sup> November 2021 in Vienna**.
