

Non-Invasive Archaeological Survey at Gyanvapi Mosque

Source: TH

Why in News?

Recently, the **Supreme Court of India** directed the **Archaeological Survey of India (ASI)** to conduct a detailed **non-invasive survey** of the **Gyanvapi mosque** in Varanasi, Uttar Pradesh to determine if the mosque was built atop a temple.

What is the Purpose of the Survey?

- The petitioners argued that the mosque was built on the **foundation of the temple** and that there were several Hindu idols and structures hidden inside the mosque.
- The court directed the ASI to form a five-member committee of experts to conduct a comprehensive physical survey of the entire Gyanvapi compound using non-invasive techniques such as ground-penetrating radar (GPR) and carbon dating.
- The survey is expected to reveal whether there are any traces of a temple or other Hindu structures below or within the mosque and to establish the age and origin of the existing structures.
- The court also appointed an observer to monitor and supervise the survey process and report any
 irregularities or violations.

What are Non-Invasive Methods in Archaeological Prospecting?

- Non-invasive methods are used when investigations are undertaken inside a built structure and no excavation is permitted.
- Types of Methods:
 - Active Methods: Inject energy into the ground and measure the response. The methods
 provide an estimate of the ground's material properties, such as density, electrical
 resistance, and wave velocity.
 - Seismic Techniques: Use shock waves to study subsurface structures.
 - Electromagnetic Methods: Measure electromagnetic responses after energy injection.
 - **Passive Methods:** Measure existing physical properties.
 - Magnetometry: Detect magnetic anomalies caused by buried structures.
 - **Gravity Surveying:** Measure gravitational force variations due to subsurface features.
 - Ground-Penetrating Radar (GPR):
 - ASI will use GPR to produce a 3-D model of buried archaeological features.
 - GPR operates by introducing a short radar impulse from a surface antenna and records time and magnitude of return signals from the subsoil.
 - Radar beam spreads like a cone, causing reflections before the antenna passes over the object.
 - Radar beams spread out in a cone, leading to reflections that may not directly correspond to physical dimensions, creating false images.
 - Carbon Dating:
 - Determine organic material age by measuring carbon content.

What are the Limitations of Various Methods in Archaeological Surveys?

- Similar physical properties of different materials can generate the same response, leading to ambiguity in identifying targets.
- Data collected is limited and contains measurement errors, making it challenging to accurately estimate the spatial distribution of properties.
- Archaeological structures are often made of heterogeneous materials with complex geometry, making data interpretation challenging.
- Geophysical tools might not accurately reconstruct target images, especially in complex scenarios.
- In cases like disputes over religious sites, emotional and political factors can influence interpretations and decisions.

Archaeological Survey of India (ASI)

- ASI, under the Ministry of Culture, is the premier organization for the archaeological research and protection of the cultural heritage of the nation.
- It administers more than 3650 ancient monuments, archaeological sites and remains of national importance.
- Its activities include carrying out surveys of antiquarian remains, exploration and excavation of archaeological sites, conservation and maintenance of protected monuments etc.
- It was founded in 1861 by Alexander Cunningham- the first Director-General of ASI. Alexander Cunningham is also known as the "Father of Indian Archaeology".
