

Japan to Flush Fukushima Wastewater

Prelims: Pacific Ocean, Tsunami, Radioactive Pollution in Water.

Mains: Issues with Nuclear Energy and Nuclear Disaster.

Why in News?

Japan is expected to start flushing 1.25 million tons of wastewater from the embattled Fukushima nuclear power plant into the [Pacific Ocean](#) in 2023, as part of a USD 76-billion project to decommission the facility.

- The project received the Japanese cabinet's approval in **2021 and could take three decades to complete.**

What is the Background?

- In March 2011, after a magnitude 9 [earthquake](#), a [tsunami](#) flooded the **Fukushima Daiichi nuclear power plant in Okuma** and damaged its diesel generators.
- The loss of power **suspended coolant supply to reactors at the facility**; the tsunami also disabled backup systems.
- Soon, radioactive materials leaked from reactor pressure vessels, **exploded in the facility's upper levels**, and exposed themselves to the **ambient air, water, soil, and local population**.
- Winds also carried **radioactive material thrown up into the air into the Pacific**. Since then, the **power plant and its surrounding land have been uninhabitable**.
- The water that the Japanese government wants to flush from the plant was **used to cool the reactors**, plus rainwater and groundwater.
- It contains radioactive **isotopes from the damaged reactors and is thus itself radioactive**. Japan has said that it will release this water into the Pacific Ocean over the next 30 years.

What are the Concerns of Releasing Water?

- There is no known threshold below which radiation can be considered safe, therefore any discharge of **radioactive materials will increase the risk of cancer and other known health impacts** to those who are exposed.
- Water released can be poisonous to the fish and anyone who happens to live in the vicinity of the discharge point can be caught precarious.
- Tokyo Electric Power Company (TEPCO) **hasn't removed tritium** from the water because this is very difficult to do.
 - Tritium is **"easily absorbed by the bodies of living creatures"** and "rapidly distributed via blood."
- There were **other radionuclides in the water** that TEPCO's treatment procedure couldn't entirely remove.
 - These include **isotopes of ruthenium and plutonium**, which could persist for longer in the bodies of marine creatures and on the seafloor.

Why Flushing Instead of Treating Water?

- The TEPCO which operates the Fukushima facility, initially planned to treat the wastewater but because of lacking enough room for the water-tanks, it decided to release the water.
- Also, Japan cannot store water for longer than discharge it, because of **Tritium's half-life** (12-13 years).
 - **Half-life is the time a radioactive material takes for its quantity to be halved through radioactive decay.**

Way Forward

- A representative of the Pacific Islands Forum, the bloc of Oceania countries including Australia, has called it **"simply inconceivable" based on their experience with "nuclear contamination"**.
- There should be more studies to understand the **precise composition of each tank before it is flushed** and for more details about TEPCO's water-treatment process.
- In addition, **the water can be stored for a longer period of time before discharging it**, due to Tritium's half-life of 12-13 years. Further, storing the water for a longer time will reduce the amount of other radioactive isotopes present in the water, thus reducing **its radioactivity**.

UPSC Civil Services Examination, Previous Year Questions (PYQs)

Prelims

Q1. The function of heavy water in a nuclear reactor is to (2011)

- (a) Slow down the speed of neutrons
- (b) Increase the speed of neutrons

- (c) Cool down the reactor
(d) Stop the nuclear reaction

Ans: (a)

Exp:

- **Heavy water (D_2O), also called Deuterium Oxide**, is water composed of Deuterium (Hydrogen isotope) **with a mass double that of regular water (H_2O)**.
- Heavy water occurs naturally, although it is much less common than regular water.
- It is commonly **used in nuclear reactors as a neutron moderator**, i.e., to slow down the speed of neutrons.
- **Therefore, option (a) is the correct answer.**

Mains

Q. With growing energy needs should India keep on expanding its nuclear energy programme? Discuss the facts and fears associated with nuclear energy. **(2018)**
