Day 70

Question 1: In modern-day Himalaya remains only a pseudo-defensive barrier. Do you agree with it? Illustrate your views.

Question 2: Based on the macro-variation discuss the physiographic features of India.

Answer 1

Approach

- Start answering with the introduction that Himalaya remains a pseudo defensive barrier.
- Explain the factors affecting the significance of Himalaya as a natural barrier.
- Write a holistic and appropriate conclusion.

Introduction

- The Himalayas have historically served as a barrier between various regions and cultures,

but in modern times, the ease of **transportation and communication** has greatly reduced their effectiveness as a defensive barrier.

- The development of **modern transportation infrastructure** such as **roads, railways, and airports**, it has become much easier for people and goods to cross the Himalayas.

Body

- Advances in technology have enabled easy communication across the mountains, further diminishing their effectiveness as a barrier.
- However, the Himalayas are still a **formidable natural barrier** in terms of **terrain and climate**, making it difficult for military forces to pass through.
- The **high altitude** and **harsh weather conditions** make it challenging for troops to operate in these regions, which can **slow down military operations**.
- Additionally, the Himalayas have significant **ecological** and **cultural value**, and have protected these areas from **overdevelopment and destruction**.
- The mountain range is home to many **endangered species** and it is also an important source of freshwater for the people living in the region.
- The Himalayas are also home to many **indigenous communities**, whose **way of life and culture** have been preserved by the challenging terrain of the mountains.
- In recent years, **China** has made significant **investments in transportation infrastructure** in the **Himalayas**, including the construction of **highways, railroads, and airports**.
- The improved **transportation infrastructure** in the **Himalayas** by China not only facilitates **trade and tourism** but also raises serious **defense concerns**.
- The increased **connectivity and accessibility** of the region can also make it easier for **military forces** to move across the mountains, which could potentially lead to a greater likelihood of conflict.

Conclusion

The Himalayas may not serve as a traditional defensive barrier, they continue to be an important **natural barrier** and **preserve important ecological and cultural resources**. It is also important to note that the Himalayas are also a point of geopolitical tension for India and China, which have border disputes and territorial claims over the region.

Answer 2

Approach

- Start answering with the introduction of physiography.
- Explain the different physiographic features of India.
- Write a holistic and appropriate conclusion.

Introduction

- Physiographic features refer to the natural landforms and topography of an area.
- These features include mountains, valleys, plateaus, rivers, lakes, and coastlines, among others. These features are determined by a combination of geologic processes and climate, and they can vary greatly from one region to another.
- The study of physiographic features is known as physiography.

Body

- **The Northern Mountains:**
 - The northern part of India is dominated by the Himalayan Mountain range, which is the highest and youngest mountain range in the world.
 - The Himalayas are home to some of the highest peaks in the world, including Mount Everest, which is the highest peak in the world.
 - The Himalayas also act as a barrier, blocking cold winds from the north and providing a stable climate for the northern regions of India.

▪ **The Northern Plains:**

- The northern plains of India are formed by the alluvial soil deposited by the major rivers such as the Ganges, Brahmaputra and the Indus.
- These rivers have created a flat and fertile region that is ideal for agriculture. The region is one of the most densely populated areas in the world.

▪ **The Peninsular Plateau:**

- The southern part of India is dominated by the **Deccan Plateau**, which is made up of **igneous** and **metamorphic rocks**.
- The plateau is characterized by a high level of variation in elevation, with steep escarpments and deep valleys.
- The plateau is also home to several hill ranges, including the **Western Ghats** and the **Eastern Ghats**.

▪ **The Coastal Plains:**

- India has a long coastline along the **Arabian Sea** and the **Bay of Bengal**.
- The **coastal plains** are narrow and are characterized by **sandy beaches, estuaries, lagoons** and **mangrove swamps**.
- The region is rich in **biodiversity** and is home to a wide variety of **plant** and **animal life**.

▪ **The Islands:**

- India also includes several islands, **the Andaman and Nicobar Islands** are located in the **Bay of Bengal** and the **Lakshadweep islands** in the **Arabian sea**.
- These islands are characterized by **coral reefs, mangrove swamps** and **tropical rainforests**.

Conclusion

India as a country in the India sub-continent, has all the climatic features ranging from polar ice caps of Himalayas to the sandy deserts of thar. The varied physiographical features of India bring a range of socio-economic and geographical uniqueness.
