

# **Genetic Markers and Preterm Birth**

# Why in News?

Recently, Indian scientists working in the <u>Garbh-Ini program</u> have identified <u>19 genetic markers</u> associated with <u>preterm birth</u>, a major cause of <u>Neonatal deaths</u> (deaths among live births during the first 28 completed days of life) and complications globally.

 The identification of genetic markers associated with preterm birth could help in predicting high-risk pregnancies and monitoring them closely, leading to improved maternal and neonatal outcomes.

#### What is Preterm Birth?

- About:
  - Preterm birth, also known as premature birth, refers to the birth of a baby before the
    completion of 37 weeks of gestation. There are sub-categories of preterm birth, based
    on gestational age:
    - Extremely preterm (less than 28 weeks)
    - Very preterm (28 to 32 weeks)
    - Moderate to late preterm (32 to 37 weeks).
  - It is a significant public health issue, especially in India and Southeast Asia, and is
    associated with delayed mental and physical development in infants and increased risks of
    diseases in adulthood.
  - Globally, one in every 10 births is preterm.
    - Also, of all babies born annually in India, about 13% are born preterm. Globally, India accounts for 23.4% of preterm births.

#### Fatality:

- Preterm babies are two to four times at higher risk of death after birth in comparison to those born after 37 weeks of gestation.
- When these babies become adults, they also become at higher risk of **diseases such as**<u>Type-2 diabetes</u>, **hypertension and** <u>cancer</u>.

### What are Genetic Markers?

- About:
  - Genetic markers, also known as DNA markers or genetic variants, are specific sections of <u>DNA</u> that are associated with particular traits, characteristics, or conditions.
  - Genetic markers can be either DNA sequences or specific variations in the DNA sequence, such as single nucleotide polymorphisms (SNPs), which are the most common type of genetic marker.

### Significance:

- They are used in genetics research and clinical practice to identify and study genetic variations that may be linked to diseases, disorders, or other biological traits.
- These SNPs are known to regulate important biological processes such as inflammation, apoptosis, cervical ripening, telomere maintenance,

#### selenocysteine biosynthesis, myometrial contraction, and innate immunity.

### Garbh-Ini

- Garbh-Ini (Interdisciplinary Group for Advanced Research on Birth Outcomes—DBT India Initiative) was initiated by the Department of Biotechnology (DBT), in 2014 as a collaborative interdisciplinary program.
- This program is led by **Translational Health Science and Technology Institute (THSTI),** NCR Biotech cluster, Faridabad.
- It aims to elucidate biological and non-biological risks of preterm birth (PTB) to create important knowledge-driven interventions and technologies that can be sustainably implemented in clinical practice and in the community for this disease.

## **UPSC Civil Services Examination, Previous Year Questions (PYQs)**

- Q. Which of the following are the objectives of 'National Nutrition Mission'? (2017)
  - 1. To create awareness relating to malnutrition among pregnant women and lactating mothers.
  - 2. To reduce the incidence of anaemia among young children, adolescent girls and women.
  - 3. To promote the consumption of millets, coarse cereals and unpolished rice.
  - 4. To promote the consumption of poultry eggs.

### Select the correct answer using the code given below:

- (a) 1 and 2 only
- **(b)** 1, 2 and 3 only
- (c) 1, 2 and 4 only
- (d) 3 and 4 only

Ans: (a)
