Sulfur Dioxide Emission Norms

Source: PIB

Why in News?

Recently, the Ministry of Power has informed Lok Sabha that, for compliance with Sulphur dioxide (SO_2) emission norms, Thermal Power Plants are installing **Flue Gas Desulphurisation (FGD) equipment.**

 The Ministry in September 2022 had extended the deadline for Coal-Fired power plants to install FGD to cut sulphur emissions by two years.

What is the Categorisation of Power Plants for Installing FGD?

Category	Location/Area	Timelines for compliance
Category A	Within 10 km radius of National Capital Region (NCR) or cities having million plus population (as per 2011 census of India)	Upto 31st December 2024
Category B	Within 10 km radius of Critically Polluted Areas or Non-attainment cities (as defined by <u>CPCB</u>)	Upto 31st December 2025
Category C	Other than those included in category A and B	Upto 31st December 2026

What is Flue Gas Desulfurization (FGD)?

About:

- FGD is the process of removing sulfur compounds from the exhaust emissions of fossil-fueled power stations.
- This is done through the **addition of absorbents**, which can remove up to 95% of the sulphur dioxide from the flue gas.
- Flue gas is the **material emitted when fossil fuels** such as coal, oil, natural **gas, or wood are burned** for heat or power.
- Need for FGD in India:
 - Indian cities have **some of the world's most polluted air.** India currently emits almost **twice the amount of SO₂** than the next highest country, Russia.
 - Thermal utilities, which produce 75% of the country's power, account for some 80% of industrial emissions of sulphur and nitrous oxides, which cause <u>Lung Diseases</u>, acid rain and smog.
 - Every single day delay in implementation of prescribed norms and not installing the

FGD system is causing huge health and economic damage to our society.

• The high **levels of damaging SO2 pollution in India are avoidable much sooner** as FGD systems have proved successful in reducing emission levels in China, which was responsible for the **highest level of SO₂ Pollution** in 2005.

What is Sulfur Dioxide Pollution?

- Source:
 - The largest source of **SO₂ in the atmosphere is the burning of fossil fuels** by power plants and other industrial facilities.
 - Smaller sources of SO₂ emissions **include** industrial processes such as **extracting metal**
 - from ore, natural sources such as volcanoes, and locomotives, ships and other vehicles.
- Impact:
 - Short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult. People with asthma, particularly children, are sensitive to these effects of SO₂.
 - The WHO has estimated that it causes 4.2 million deaths globally per year.
 - SO₂ emissions that **lead to high concentrations of SO₂** in the air generally also lead to the formation of other sulfur oxides (SOx).
 - SOx can react with other compounds in the atmosphere to form small particles. These particles contribute to <u>Particulate Matter (PM)</u> pollution.
