

Nipah Virus

Source: IE

Why in News?

The Nipah Virus has made a resurgence in Kerala, India, with two fatalities.

■ This marks the first Nipah Virus outbreak in India since 2021 when a case was reported in Kozhikode during the Covid-19 pandemic.

What is Nipah Virus?

- About:
 - It is a **zoonotic virus** (it is transmitted from animals to humans).
 - The organism that causes Nipah Virus encephalitis is an RNA or <u>Ribonucleic acid virus</u> of the family Paramyxoviridae, genus Henipavirus, and is closely related to Hendra virus.
 - **Hendra virus (HeV) infection** is a rare emerging zoonosis that causes severe and often fatal diseases in both infected horses and humans.
 - It first broke out in Malaysia and Singapore in 1998 and 1999.
 - The disease is named after a village in Malaysia, Sungai Nipah, where it was first detected.
 - It first appeared in domestic pigs and has been found among several species of domestic animals including dogs, cats, goats, horses and sheep.
- Transmission:
 - The disease spreads through <u>fruit bats</u> or 'flying foxes,' of the genus Pteropus, who are natural reservoir hosts of the Nipah and Hendra viruses.
 - The virus is present in bat urine and potentially, bat faeces, saliva, and birthing fluids.
- Symptoms:
 - The human infection presents as an encephalitic syndrome marked by fever, headache, drowsiness, disorientation, mental confusion, coma, and potentially death.
- Prevention:
 - Currently, there are **no vaccines for both humans and animals.** Intensive supportive care is given to humans infected by the Nipah virus.
