

Human Cost of Disasters 2000-2019: UNDRR

Why in News

In a new report "The Human Cost of Disasters 2000-2019", the United Nations pointed out that climate change is largely to blame for a near doubling of natural disasters in the past 20 years.

- The report is published by the <u>United Nations Office for Disaster Risk Reduction</u> (UNDRR). The report did not touch on biological hazards and disease-related disasters like the coronavirus pandemic.
- International Day for Disaster Risk Reduction is observed on 13th October every year.

Key Points

Findings:

- 7,348 major disaster events had occurred between 2000 and 2019, affecting 4.2 billion people and costing the global economy some USD 2.97 trillion.
 - The figure is far more than the 4,212 major natural disasters recorded between 1980 and 1999.
- **6,681 climate-linked disasters** had been recorded in the period 2000-19, up from 3,656 during the previous 20-year-period.
 - Climate-related disasters include disasters categorized as meteorological, climatological, or hydrological.
 - There had also been an **increase in geophysical events** like earthquakes and tsunamis that are **not related to climate** but are particularly deadly.
- Major floods had more than doubled to 3,254, there had been 2,034 major storms up from 1,457 in 20 years.
 - India is the 2nd most affected country by floods after China.
- Extreme heat is proving especially deadly. Heatwaves of 2015 in India resulted in 2,248 deaths.
- The deadliest single disaster in the past 20 years was the 2004 Indian Ocean tsunami, with 2,26,400 deaths, followed by the Haiti earthquake in 2010, which claimed some 2,22,000 lives.
- The data showed that Asia has suffered the highest number of disasters in the past 20 years with 3,068 such events, followed by the Americas with 1,756 and Africa with 1,192.
- In terms of affected countries, **China** topped the list with 577 events followed by the **United States** with 467 and **India** (321 events).

Concern:

- Governments are not doing enough to prevent climate hazards.
- A temperature increase of 3°C of the global climate is estimated to increase the frequency of potentially high impact natural hazard events across the world. This could render current national and local strategies for disaster risk reduction and climate change adaptation obsolete in many countries.

 Shifting rainfall patterns and greater variability in precipitation poses a risk to the 70% of global agriculture that is rain-fed and the 1.3 billion people dependent on degrading agricultural land.

Recommendations:

- The concentrated impact due to a single disaster in some countries provides an opportunity for a more focused approach on disaster risk reduction. However, <u>Covid-19</u> demonstrates the need for a systemic, multi hazard approach in an increasingly globalized and interconnected world.
- There is a requirement for strengthening disaster risk governance to manage disaster risk with clear vision, competence, plans, guidelines, funding and coordination across sectors and in a manner, which takes account of the increasingly systemic nature of disaster risk.
- Public and private investment in disaster risk prevention and reduction through structural and non-structural measures needs to be stepped up to create disaster resilient societies.

United Nations Office for Disaster Risk Reduction

- The UNDRR was **established in 1999** as a dedicated secretariat to facilitate the implementation of the **International Strategy for Disaster Reduction (ISDR).**
- It is headquartered in **Geneva**, **Switzerland**.
- It is mandated to serve as the focal point in the United Nations system for the coordination of disaster reduction and to ensure synergies among the disaster reduction activities.
- It is an organisational unit of the UN Secretariat and is led by the UN Special Representative of the Secretary General for Disaster Risk Reduction (SRSG).
- UNDRR's Strategic Framework 2016-2021 has a vision to substantially reduce disaster risk
 and losses for a sustainable future with the mandate to act as the custodian of the Sendai
 Framework (India is a signatory).

Indian Scenario

- The National Disaster Management Authority (NDMA) is the apex statutory body for disaster management in India.
- The NDMA was formally constituted in 2006, in accordance with the <u>Disaster Management Act</u>, 2005 with the Prime Minister as its Chairperson.
- National Disaster Management Plan (NDMP) defines the roles and responsibilities of various stakeholders including Central Ministries/ Departments, State Governments, UT Administrations, District Authorities and local self Governments.
 - Primary responsibility of disaster management rests with the States.
 - The **Central Government** conducts regular mock drill, community training and awareness programmes to prepare the civilian populations for disasters.
