

China's Renewed Support for Paris Agreement

Why in News

Recently, China has renewed its support for the <u>Paris Agreement</u> at the <u>United Nations</u> (UN) **General Assembly,** while calling for a **'green focus'** as the world recovers from the <u>Covid-19</u> crisis.

Key Points

- China is the world's biggest polluter and accounts for a quarter of the planet's greenhouse gas (GHG) emissions.
- It now aims to reach carbon-dioxide emissions peak before 2030 and achieve carbon neutrality before 2060.
 - The 2060 objective is still a decade later than the date set by other small states as well as European powers but it has been appreciated by experts as a significant step to inject momentum into the Paris accord.
- In addition to its embrace of global emissions-busting deals, China already feeds nearly 15% of
 its energy demands with non-fossil fuels and its installation of renewable energy stands at
 30% of the world total.
- However, global experts have highlighted that there are massive investments continuing within China and overseas in coal and other fossil fuels.
 - China currently has 135 gigawatts of coal-power capacity either permitted or under construction, according to Global Energy Monitor, a San Francisco-based environmental group.
 - This equates to about half the total coal-power capacity in the USA which is the second-largest polluter after China.
- Against the USA:
 - China highlighted USA's demand for plastics and export of waste and criticised it for "obstructing" the global fight against emissions.
 - Earlier, the **USA** had pulled out of the Paris agreement, calling it unfair and blamed China for the stalled momentum on tackling global emissions.
 - This move has opened a new divergence in <u>US-China relations</u> which are already troubled over issues like <u>trade</u>, technology, defence and human rights.

Paris Agreement

- Paris Agreement (also known as the Conference of Parties 21 or COP 21) is a landmark environmental accord that was adopted in 2015 to address climate change and its negative impacts.
 - It replaced the **Kyoto Protocol** which was an earlier agreement to deal with climate change.
- Aims: To reduce global GHG emissions in an effort to limit the global temperature increase in this century to well below 2°C above pre-industrial levels, while pursuing means to limit

the increase to 1.5°C by 2100.

- It includes:
 - Addressing the financial losses vulnerable countries face from climate impacts such as extreme weather.
 - Raising money to help developing countries adapt to climate change and transition to clean energy.
 - This part of the deal has been made **non-legally binding on developed countries.**
- Before the conference started, more than 180 countries had submitted pledges to cut their carbon emissions (Intended Nationally Determined Contributions or INDCs).
 - The INDCs were recognised under the agreement, but are not legally binding.
 - India also reaffirmed its INDCs commitments to meeting the goals under the Agreement in order to combat the climate change.
