Kakrapar Atomic Power Project

For Prelims: <u>Kakrapar Atomic Power Project</u>, Regulated Fission Reaction, Atomic Energy Regulatory Board (AERB).

For Mains: Kakrapar Atomic Power Project, Ways to Enhance India's Nuclear Power Capacity.

Source: TH

Why in News?

Recently, the fourth unit of <u>Kakrapar Atomic Power Station (KAPS)</u>, Gujarat has achieved its **first Criticality** — the beginning of the regulated fission reaction — paying the way for its eventual transition to generating power for commercial use.

What is Criticality?

- Criticality is the first step towards power production. A nuclear reactor is said to be critical when the nuclear fuel inside a reactor sustains a fission chain reaction.
- Each fission reaction releases a sufficient number of neutrons to sustain a series of reactions.
 Heat is produced in the event, which is used to generate steam that spins a turbine to create electricity.
 - **Fission is a process** in which the nucleus of an atom splits into two or more smaller nuclei, and some byproducts.
 - When the nucleus splits, the **kinetic energy of the fission fragments (primary nuclei) is transferred** to other atoms in the fuel as heat energy, which is eventually used to produce steam to drive the turbines.

What is the Significance of Achieving First Criticality?

- Milestone for Power Generation:
 - This stage demonstrates that the **reactor can produce a controlled and continuous chain reaction,** essential for sustained power generation. It's a precursor to full operation and power generation for commercial use.
- Technology Advancements:
 - The Kakrapar reactors, particularly Units 3 and 4, boast advanced safety features inspired by lessons from past nuclear incidents like the **Fukushima Daiichi disaster.**
 - These include steel-lined containment systems and passive decay heat removal systems, enhancing safety and reliability.
- Energy Sustainability and Climate Goals:
 - Nuclear energy, as a **low-carbon source, aligns with India's climate goals** to increase its renewable energy share.
 - India aims to generate 50% of its electricity from non-fossil fuel sources by 2030, as pledged at international forums like the <u>United Nations Convention of Parties</u> (COP26).

What are the Key Points about the Kakrapar Reactor?

- Existing KAPS reactors Unit-1 and Unit-2 have a capacity of 220 MW each. But the new 700MW projects, Unit-3 and Unit-4, are **among the safest reactors** in the world.
- The Unit-3 and 4 reactors have steel-lined inner containment systems that prevent any radioactive material from escaping in case of an accident.
- They also have passive decay heat removal systems, which safely cool down the reactor even when it is shut down.

How has India's Nuclear Journey Been?

Early Development:

- India's nuclear program started in the 1940s and gained momentum with the establishment of the **Atomic Energy Commission (AEC) in 1948.**
- Homi Bhabha, known as the **father of India's nuclear program,** played a pivotal role in its early stages.

Peaceful Nuclear Explosions:

- India conducted its **first peaceful nuclear explosion as operation Smiling Buddha** 1974, in Pokhran, marking its entry into nuclear technology.
- In May 1998 Pokhran-II was conducted as a series of five nuclear tests including one
 - thermonuclear test aimed at demonstrating nuclear weapon capability
- Civil Nuclear Cooperation:
 - Despite being outside the <u>Nuclear Non-Proliferation Treaty (NPT)</u>, India negotiated civil nuclear agreements with various countries, including the <u>Indo-US Civil Nuclear</u> <u>Agreement in 2008</u>, allowing for technology cooperation and nuclear fuel supply.

Indigenous Nuclear Capabilities:

- India developed indigenous nuclear technology, including <u>Pressurised Heavy Water</u> <u>Reactors (PHWRs)</u> and Fast Breeder Reactors (FBRs), showcasing self-reliance and scientific prowess.
 - India's nuclear power generation capacity grew steadily, with the Nuclear Power Corporation of India Limited (NPCIL) leading the construction and operation of nuclear reactors across the country.

Safety and Regulations:

- India focused on stringent safety standards and regulatory measures overseen by the Atomic Energy Regulatory Board (AERB) to ensure the safe operation of nuclear facilities.
 - Nuclear energy played a role in diversifying India's energy mix, contributing to energy security and reducing dependence on fossil fuels.

Current Status and Future Plans:

- Currently, India has 23 nuclear power reactors in operation under NPCIL (Nuclear Power Corporation of India), with a total capacity of 7,480 MW.
- NPCIL is constructing nine more reactors, including KAPS Unit-4, with a total capacity of 7,500 MW.
- As of 2023, India has a total generation capacity of 417 GW, out of which 43 percent is from renewable sources. However, nuclear energy still has a small role in India's total energy generation, despite its rapid growth.
 - In 2022-23, nuclear energy formed around 2.8 percent of India's total energy production, according to government data.
- India has set ambitious targets to significantly increase its nuclear energy production, aiming to triple its capacity by 2031.
- However, challenges such as **public concerns over safety, land acquisition, and regulatory hurdles remain.**

UPSC Civil Services Examination, Previous Year Questions (PYQs)

<u>Prelims</u>

Q. The function of heavy water in a nuclear reactor is to (2011)

(a) Slow down the speed of neutrons
(b) Increase the speed of neutrons
(c) Cool down the reactor
b Stop the nuclear reaction

Ans: (a)

Mains

Q. With growing energy needs should India keep on expanding its nuclear energy programme? Discuss the facts and fears associated with nuclear energy. **(2018)**

The Vision
