

# ISRO's SSLV-D2

## Why in News?

In its second attempt, the Indian Space Research Organisation (ISRO)'s smallest vehicle, Small Satellite Launch Vehicle (SSLV-D2), was launched from the Satish Dhawan Space Centre, Sriharikota, Andhra Pradesh.

- The **vehicle's first development flight (SSLV D1)** that took place in August 2022 failed to place the satellites in precise orbit.
- This time structural changes have been made to the equipment bay, along with changes in the separation mechanism for stage 2, and logic changes for the on-board system.

The Vision,

Note

- A new vehicle is declared operational by ISRO after it completes two successful development flights.
- The last vehicle to be declared operational was the GSLV Mk III, now called <u>LVM 3</u>, when it carried <u>Chandrayaan-2</u> in 2019.

What's Onboard in SSLV-D2?

SSLV-D2 will place the ISRO's <u>earth observation satellite</u> EOS-07 and two co-passenger

#### satellites - Janus-1 and AzaadiSat2.

- Janus-1:
  - It is a technology demonstrator satellite built by US-based Antaris and its Indian partners XDLinks and Ananth Technologies.
  - It is a **six-unit cube satellite** with five payloads on board two from Singapore, and one each from Kenya, Australia, and Indonesia.
- AzaadiSat2:
  - It is a **Cubesat** weighing around 8 kg and carries 75 different payloads.
  - Girl students from rural regions across the country were provided guidance to build these payloads.
  - The payloads are integrated by the student team of "Space Kidz India".

#### • EOS-07:

- EOS-07 is a 156.3 kg satellite designed and developed by ISRO.
- Its mission objective is to design and develop payload instruments compatible with microsatellite buses and new technologies for future operational satellites.

### What is a Small Satellite Launch Vehicle?

- About:
  - SSLV is a 3 **stage Launch Vehicle** configured with three Solid Propulsion Stages and Liquid propulsion-based Velocity Trimming Module (VTM) as a terminal.
  - It is **2 m in diameter and 34m in length with** a lift off weight of 120 tonnes and is capable of launching a 10 to 500 kg satellite in **500 km planar orbit**.
  - The rocket **can be assembled by a small team in only a few days, compared** to the 6 months and around 600 people it takes for ISRO's workhorse **PSLV**.
- Objective:
  - It has been developed to **capture the emerging small (nano-micro-mini) satellite** commercial market, with launches offered on demand.

#### Significance:

 It provides low-cost access to Space, offers low turn-around time, facilitates flexibility in accommodating multiple satellites and demands minimal launch infrastructure.
