Why in News?

A recent Lancet Commission paper highlights the alarming **rise in prostate cancer cases in India**, leading to a higher mortality rate due to late-stage diagnosis.

- In India, a large number of patients are diagnosed with advanced-stage cancer, leading to a **65% mortality rate**.
- Globally, **prostate cancer cases are expected to double by 2040**, with low and middle-income countries facing the most significant rise, including India where new cases are projected to reach 71,000 annually.

What is Prostate Cancer?

- **About:** Prostate cancer is a type of cancer that develops in the **prostate, a small gland in the male reproductive system** located below the bladder. The prostate gland produces fluid that nourishes and transports sperm.

- **Prevalence:** The Lancet Commission report predicts a global surge in prostate cancer cases, with low and middle-income countries facing the most substantial increase.
 - Worldwide, prostate cancer was responsible for approximately 3,75,000 deaths in 2020, ranking it as the **fifth leading cause of cancer-related deaths in men**.
 - It currently accounts for **3% of all cancers in India**, with an estimated 33,000-42,000 new cases annually.
 - Ageing populations and increasing life expectancy contribute to higher numbers of older men, increasing the risk of prostate cancer.
- **Risk Factors:** The risk factors for prostate cancer include age (especially over 50), genetics, diet, obesity, smoking, chemical exposure, prostate inflammation, and hormonal factors.
- **Symptoms:** Prostate cancer is typically **asymptomatic in its early stages**, but symptoms may include difficulty urinating, frequent urination (especially at night), blood in the urine, erectile dysfunction, and lower back or thigh pain.
- **Detection: Prostate-specific antigen (PSA)** blood test measures the level of PSA in the blood. **Elevated PSA levels can be a sign of prostate cancer**, but they can also be caused by other factors.
- **Treatment:**
 - **Surgery:** Surgery to remove the prostate gland (**radical prostatectomy**) is a common treatment option.
 - **Radiation therapy:** Radiation therapy uses high-energy rays to kill cancer cells.
 - **Hormone therapy:** Also called androgen deprivation therapy (ADT), it is a treatment that **reduces the amount of testosterone in the body**.

- **Brachytherapy:** This treatment implants radioactive seeds directly into the prostate gland.
