

Earth's Black Box

Why in News

Australian scientists and artists are going to make black box of the planet to hold the world

accountable for their actions by creating a black box of the planet.

Key Points

About:

- The box will be constructed in Tasmania, an Australian island state off the south coast.
- It will be made with 3-inch thick steel and covered with solar panels.
- It will **operate much like a plane's flight recorder,** which records an aircraft's final moments before crashing.
- The storage drives inside Earth's Black Box are designed to last for around 30 to 50 years.
- The black box will be around the size of a city-bus, and inside there will be storage
 drives that record climate change conversations and also atmospheric carbon dioxide
 levels and average temperatures.
- Types of Data Collection by the Box:
 - Two different types of data will be collected and stored inside the monolith.
 - It will collect **climate-change-related data** like land and sea temperature measurements, **species extinction**, energy consumption, human population, **ocean acidification**, and atmospheric CO₂ levels.
 - It will collect contextual data, like newspaper headlines and trending stories, key news stories and social media posts.
- Reason for choosing the Tasmania:
 - Tasmania was chosen for its relative geopolitical and environmental safety, and the

monolith will be designed to be **resilient against threats** including **cyclones**, **earthquakes** and, with its sloped walls, attacks by vandals.

- Significance:
 - Black box will actually help in preventing a major climate change catastrophe.
 - <u>Climate change</u> is one of the gravest threats humanity faces and is exacerbating economic and health inequalities, increasing the frequency and intensity of natural disasters and threatening the world's food supply.
